Summary

Aspiring Backend Engineer with a solid foundation in core programming and backend development, specializing in Python (Django) and Node.js. Developed RESTful APIs and implemented CRUD operations using Django REST Framework and Node.js. Eager to leverage skills in backend engineering to contribute to innovative digital solutions.

Skills

- **Languages & Frameworks**: Python (Django), JavaScript (Node.js), HTML, CSS
- **Back-End & APIs**: RESTful API design, CRUD operations, Django REST Framework, Node.js
- **Databases & Caching**: SQLite, Redis (Django Channels)
- **Tools & Practices**: Git & GitHub workflows, unit testing (pytest), Docker basics, Postman

Projects

E-COMMERCE INVENTORY API (NODE.JS, EXPRESS, MONGODB)

- Built a backend RESTful API inventory management system with 30+ CRUD endpoints for products, categories users, variations and orders.
- Created data models – virtual IDs & validation – enabling relational queries and JSON responses.
- Implemented JWT-based authentication with role-based access control, passwords salted/hashed via bcrypt.
- Centralized error-handling & request logging (morgan) for uniform responses and faster debugging.
- Link: GitHub: https://github.com/Blink17072002/Inventory_management_API

DISCORD-LIKE STUDY APP (DJANGO)

- Developed a full-stack application enabling users to create, join and manage topic-based “Rooms", complete with CRUD operations, search, activity feed and permissioned-controlled message threads.
- Designed and iimplemented a custom AbstractUser model (email-as-login) with profile editing and avatar uploads, reusable Mod-elForms, admin registrations, streamlining authentication and enhancing user-experience.
- Built RESTful API endpoints with Django REST framework and configured CORS, allowing external clients (e.g vanilla JS fetch demo) to consume room data seamlessly.

- Demo: https://iamblink.pythonanywhere.com/

REAL-TIME CHAT APP (DJANGO CHANNELS, WEBSOCKETS, DAPHNE & REDIS)

- Built a custom MySQL data model (Users, Rooms, Messages) and an email-based AbstractUser, and an authentication backend to streamline secure sign-up and login flows.
- Implemented asynchronous message handling and background persistence, achieving non-blocking performance.
- Created responsive front-end components (HTML, CSS & JS) and reusable Django templates.
- Link: GitHub: https://github.com/Blink17072002/chatapp

AI CHAT-BOT (DJANGO)

- Developed a chat-gpt style web app that calls OpenAI GPT-4o model to deliver domain-constrained (medical) answers, wiring the OpenAI SDK into Django views and externalizing secrets via environment variables/ dotenv.
- Engineered robust conversation persistence: chats are stored through Django ORM, tied either to the authenticated user or to an anonymous session key, so both logged-in and guest users keep a continuous dialogue history across page refreshes.
- Implemented complete auth flow (register, login, logout) on top of Django's security framework and exposed admin dashboards for chat logs, demonstrating end-to-end user management and data administration.
